a. This is a “10second, two - point, line fit, time axis intercept”

b. Intial procedure was not appropriate. Procedure was revised for Thursday’s Section.

Ten second, two point line fit, time axis intercept

This is a crude measure of neutralization time. It’s advantage is that it standardizes your measurements enabling a comparsion across groups.

In your design, you must decide upon a residence time which will be, no doubt, of longer duration. Just how long depends upon how “conservative” you choose to be.
