6.041/6.431: Probabilistic Systems Analysis (Fall 2010)

#### Problem Set 4 Due October 6, 2010

1. Random variables X and Y have the joint PMF

$$p_{X,Y}(x,y) = \begin{cases} c(x^2 + y^2), & \text{if } x \in \{1,2,4\} \text{ and } y \in \{1,3\}, \\ 0, & \text{otherwise.} \end{cases}$$

- (a) What is the value of the constant c?
- (b) What is P(Y < X)?
- (c) What is P(Y > X)?
- (d) What is P(Y = X)?
- (e) What is P(Y = 3)?
- (f) Find the marginal PMFs  $p_X(x)$  and  $p_Y(y)$ .
- (g) Find the expectations  $\mathbf{E}[X]$ ,  $\mathbf{E}[Y]$  and  $\mathbf{E}[XY]$ .
- (h) Find the variances var(X), var(Y) and var(X+Y).
- (i) Let A denote the event  $X \geq Y$ . Find  $\mathbf{E}[X \mid A]$  and  $\operatorname{var}(X \mid A)$ .
- 2. The newest invention of the 6.041/6.431 staff is a three-sided die with faces numbered 1, 2, and 3. The PMF for the result of any one roll of this die is

$$p_X(x) = \begin{cases} 1/2, & \text{if } x = 1, \\ 1/4, & \text{if } x = 2, \\ 1/4, & \text{if } x = 3, \\ 0, & \text{otherwise.} \end{cases}$$

Consider a sequence of six independent rolls of this die, and let  $X_i$  be the random variable corresponding to the *i*th roll.

- (a) What is the probability that exactly three of the rolls have result equal to 3?
- (b) What is the probability that the first roll is 1, given that exactly two of the six rolls have result of 1?
- (c) We are told that exactly three of the rolls resulted in 1 and exactly three resulted in 2. Given this information, what is the probability that the sequence of rolls is 121212?
- (d) Conditioned on the event that at least one roll resulted in 3, find the conditional PMF of the number of 3's.
- 3. Suppose that X and Y are independent, identically distributed, geometric random variables with parameter p. Show that

$$\mathbf{P}(X = i \mid X + Y = n) = \frac{1}{n-1}, \quad \text{for } i = 1, 2, \dots, n-1.$$

# **6.041/6.431:** Probabilistic Systems Analysis (Fall 2010)

- 4. Consider 10 independent tosses of a biased coin with a probability of heads of p.
  - (a) Let A be the event that there are 6 heads in the first 8 tosses. Let B be the event that the 9th toss results in heads. Show that events A and B are independent.
  - (b) Find the probability that there are 3 heads in the first 4 tosses and 2 heads in the last 3 tosses.
  - (c) Given that there were 4 heads in the first 7 tosses, find the probability that the 2nd head occurred during the 4th trial.
  - (d) Find the probability that there are 5 heads in the first 8 tosses and 3 heads in the last 5 tosses.
- 5. Consider a sequence of independent tosses of a biased coin at times  $t = 0, 1, 2, \ldots$  On each toss, the probability of a 'head' is p, and the probability of a 'tail' is 1 p. A reward of one unit is given each time that a 'tail' follows immediately after a 'head.' Let R be the total reward paid in times  $1, 2, \ldots, n$ . Find  $\mathbf{E}[R]$  and var(R).
- $G1^{\dagger}$ . A simple example of a random variable is the *indicator* of an event A, which is denoted by  $I_A$ :

$$I_A(\omega) = \begin{cases} 1, & \text{if } \omega \in A \\ 0, & \text{otherwise.} \end{cases}$$

- (a) Prove that two events A and B are independent if and only if the associated indicator random variables,  $I_A$  and  $I_B$  are independent.
- (b) Show that if  $X = I_A$ , then  $\mathbf{E}[X] = \mathbf{P}(A)$ .
