

Section 6 Solutions

[6A-1] All of these use the ratio test:

if $\lim_{n \rightarrow \infty} \left| \frac{b_{n+1}}{b_n} \right| = L$, $\sum b_n$ converges if $L < 1$
diverges if $L > 1$.

a) $n \times \left| \frac{(n+1)x^{n+1}}{n x^n} \right| = \left(\frac{n+1}{n} \right) |x| \rightarrow |x|$
as $n \rightarrow \infty$

\therefore converges if $|x| < 1$, so $R = 1$

b) $\left| \frac{x^{2(n+1)}}{(n+1)2^{n+1}} \cdot \frac{n \cdot 2^n}{x^{2n}} \right| = \frac{n}{(n+1)^2} \cdot |x|^2$

as $n \rightarrow \infty$ $\rightarrow \frac{1}{2} |x|^2$, and $\frac{|x|^2}{2} < 1$
if $|x| < \sqrt{2}$

\therefore converges if $|x| < \sqrt{2}$, so $R = \sqrt{2}$

c) $\left| \frac{(n+1)! x^{n+1}}{n! x^n} \right| = (n+1) |x| \rightarrow \infty$
as $n \rightarrow \infty$
(if $x \neq 0$).

\therefore converges only when $x=0$,
 $R=0$.

d) $\left| \frac{[2(n+1)]!}{(n+1)!^2} \cdot x^{n+1} \cdot \frac{(n!)^2}{(2n)! x^n} \right|$

$= \frac{(2n+2)(2n+1)}{(n+1)(n+1)} \cdot |x| \rightarrow 4|x|$
as $n \rightarrow \infty$

\therefore converges if $4|x| < 1$, i.e., $|x| < \frac{1}{4}$,
so $R = 1/4$

[6A-2] a) $\frac{1}{1-x} = \sum_0^\infty x^n$

$\therefore \frac{d}{dx} \left(\frac{1}{1-x} \right) = \frac{1}{(1-x)^2} = \sum_1^\infty n x^{n-1}$
 $= \sum_0^\infty (n+1) x^n$

(replacing n by $n+1$).

b) $e^x = \sum_0^\infty \frac{x^n}{n!}$, $\therefore e^{-x} = \sum_0^\infty \frac{(-1)^n x^{2n}}{n!}$

$x e^{-x^2} = \sum_0^\infty \frac{(-1)^n x^{2n+1}}{n!}$

[6A-2c] $\frac{d}{dx} \tan^{-1} x = \frac{1}{1+x^2} = \sum_0^\infty (-1)^n x^{2n}$

Integrating:

$$\tan^{-1} x = \sum_0^\infty \frac{(-1)^n x^{2n+1}}{2n+1} + C$$

($C=0$: substitute $x=0$ on both sides)
to see that $C=0$

d) $\frac{d}{dx} \ln(1+x) = \frac{1}{1+x} = \sum_0^\infty (-1)^n x^n$

Integrating:

$$\ln(1+x) = \sum_0^\infty \frac{(-1)^n x^{n+1}}{n+1} + C = 0$$

(see that $C=0$ by substituting $x=0$ on both sides)

[series could also be written $\sum_1^\infty (-1)^{n-1} \frac{x^n}{n}$]
(putting n for $n+1$)

[6A-3a] $y = \sum_0^\infty \frac{x^{2n+1}}{(2n+1)!}$

$$y' = \sum_0^\infty \frac{(2n+1)x^{2n}}{(2n+1)!} = \sum_0^\infty \frac{x^{2n}}{(2n)!}$$

$$y'' = \sum_1^\infty \frac{2n x^{2n-1}}{(2n)!} = \sum_1^\infty \frac{x^{2n-1}}{(2n-1)!}$$

the 0 term disappears
 $= \sum_0^\infty \frac{x^{2n+1}}{(2n+1)!}$ (changing $n \rightarrow n+1$)

This shows $y'' = y$, or $y'' - y = 0$.

b) $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \dots$

$$e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \frac{x^5}{5!}$$

$\therefore \frac{e^x - e^{-x}}{2} = \frac{2x}{2} + \frac{2x^3}{3!} + \frac{2x^5}{5!} + \dots$

$$= \sum_0^\infty \frac{x^{2n+1}}{(2n+1)!}.$$

[6a) $\sum_0^\infty x^{3n+2} = x^2 \sum_0^\infty x^{3n}$

$$= x^2 \cdot \frac{1}{1-x^3}.$$

(since $\sum_0^\infty x^{3n} = \sum_0^\infty (x^3)^n = \frac{1}{1-(x^3)}$).

(6A-4b) Start with $\sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$
Integrate both sides:

$$\sum_{n=0}^{\infty} \frac{x^{n+1}}{n+1} = -\ln(1-x) + C \quad \begin{matrix} (\text{substitute}) \\ x=0 \end{matrix}$$

$$\therefore \sum_{n=0}^{\infty} \frac{x^n}{n+1} = -\frac{\ln(1-x)}{x}.$$

4c) Start with $\sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$
Differentiating, $\sum_{n=1}^{\infty} nx^{n-1} = \frac{1}{(1-x)^2}$

$$\therefore \sum_{n=1}^{\infty} nx^n = \frac{x}{(1-x)^2}$$

note $\frac{0}{0}$ or 0
(makes no difference)

[6B-1]

a) Since $y(0)=1$,
 $y = 1 + a_1 x + a_2 x^2 + a_3 x^3$
 $y' = a_1 + 2a_2 x + 3a_3 x^2 + 4a_4 x^3$
 $y^2 = (1 + a_1 x + a_2 x^2 + \dots)(1 + a_1 x + a_2 x^2 + \dots)$
 $= 1 + 2a_1 x + (2a_2 + a_1^2)x^2 + \dots$
 $+ (2a_3 + 2a_2 a_1)x^3 + \dots$ (this is far enough to get a_3)

$$y' = x + y^2 \quad \text{says that}$$

$$a_1 + 2a_2 x + 3a_3 x^2 + \dots = 1 + (2a_1 + 1)x + (2a_2 + a_1^2)x^2 + \dots$$

∴ equating coefficients of like powers of x gives us:

$$a_1 = 1, 2a_2 = 2a_1 + 1 = 3, \therefore a_2 = \frac{3}{2}$$

$$3a_3 = 2a_2 + a_1^2 = 4, \therefore a_3 = \frac{4}{3}$$

so:
$$y = 1 + x + \frac{3}{2}x^2 + \frac{4}{3}x^3 + \dots$$

b) Using Taylor's formula: $y(0)=1$

$$y' = x + y^2 \quad \therefore y'(0) = 0 + 1^2 = 1$$

$$y'' = 1 + y' \cdot 2y \quad \therefore y''(0) = 1 + 1 \cdot (2 \cdot 1) = 3$$

$$y''' = y'' \cdot 2y + y' \cdot 2y' \quad \therefore y'''(0) = 3 \cdot 2 + 1 \cdot 2 = 8$$

[6B-2]

a) $y = \sum_{n=0}^{\infty} a_n x^n$
 $y' = \sum_{n=0}^{\infty} n a_n x^{n-1} \rightarrow \sum_{n=0}^{\infty} (n+1) a_{n+1} x^n$

$$y' - y = x \quad \text{says that}$$

$$(n+1)a_{n+1} - a_n = 0 \quad \text{if } n \neq 1$$

$$= 1 \quad \text{if } n = 1,$$

that is, (since $y(0)=0$):

$$a_0 = 0, \quad a_{n+1} = \frac{a_n}{n+1} \quad \text{if } n \neq 1$$

$$\text{and } 2a_2 - a_1 = 1.$$

This gives:

$$a_0 = 0, a_1 = 0, a_2 = \frac{1}{2}, a_3 = \frac{1}{3} \cdot \frac{1}{2},$$

$$a_4 = \frac{1}{4} \cdot \frac{1}{3} \cdot \frac{1}{2}, \text{ etc.}$$

so $y = \sum_{n=2}^{\infty} \frac{x^n}{n!} = e^x - 1 - x$

b) $y = \sum_{n=0}^{\infty} a_n x^n \rightarrow -xy = \sum_{n=0}^{\infty} a_n x^{n+1}$
 $y' = \sum_{n=0}^{\infty} n a_n x^{n-1} \rightarrow \sum_{n=0}^{\infty} (n+2) a_{n+2} x^{n+1}$
note

$$y' = -xy \Rightarrow \cancel{-xy}$$

$$(n+2)a_{n+2} = -a_n \quad n=0, 1, 2, \dots$$

$$a_1 = 0 \quad (\text{corresponding to } n=-1)$$

$$a_0 = 1 \quad (\text{since } y(0)=1)$$

$$\therefore a_{n+2} = -\frac{a_n}{n+2} \quad n=0, 1, 2, \dots$$

so

$$a_0 = 1, a_2 = -\frac{1}{2}, a_4 = \frac{1}{4} \cdot \frac{1}{2}, a_6 = -\frac{1}{6 \cdot 4 \cdot 2}$$

$$a_1 = a_3 = a_5 = \dots = 0.$$

so $y = \sum_{n=0}^{\infty} \frac{x^{2n} (-1)^n}{2^n \cdot n!} = e^{-x^2/2}$

By Taylor's formula,

$$y = y(0) + y'(0)x + \frac{y''(0)}{2!}x^2 + \frac{y'''(0)}{3!}x^3$$

$$\therefore y = 1 + x + \frac{3}{2}x^2 + \frac{8}{6}x^3 + \dots$$

just as in part (a).

[6B-2]

c) $y = \sum_0^{\infty} a_n x^n$
 $y' = \sum_0^{\infty} n a_n x^{n-1} \rightsquigarrow \sum_0^{\infty} (n+1) a_{n+1} x^n$
 $\times y' = \sum_0^{\infty} n a_n x^n$

$\therefore (1-x)y' - y = 0 \Rightarrow$ (equating the coeff of x^n to 0)

$$(n+1)a_{n+1} - n a_n - a_n = 0$$

or $a_{n+1} = \frac{(n+1)}{n+1} a_n = a_n$

$$y(0) = 1 \Rightarrow a_0 = 1$$

$\therefore y = 1 + x + x^2 + x^3 + \dots = \frac{1}{1-x}$

[6C-1]

- a) $\sum_1^{\infty} a_n x^{n+3} = \sum_{n \rightarrow n-3}^{\infty} a_{n-3} x^n$
 this starts with x^4 , so this must also ↑
- b) $\sum_0^{\infty} n(n-1)a_n x^{n-2} = \sum_{n \rightarrow n+2}^{\infty} (n+2)(n+1)a_{n+2} x^n$
 starts with x^0 , so this must also ↑
- c) $\sum_1^{\infty} (n+1)a_n x^{n-1} = \sum_{n \rightarrow n+1}^{\infty} (n+2)a_{n+1} x^n$
 starts with x^0 , so this must also ↑

[6C-2]

$$y = \sum_0^{\infty} a_n x^n \rightsquigarrow 4y = \sum_0^{\infty} 4a_n x^n$$

$$y'' = \sum_0^{\infty} a_n \cdot n(n-1)x^{n-2} \rightsquigarrow \sum_{n \rightarrow n+2}^{\infty} a_{n+2} (n+2)(n+1)x^n$$

$$y'' - 4y = 0 \Rightarrow a_{n+2} (n+2)(n+1) - 4a_n = 0$$

or
$$\boxed{a_{n+2} = \frac{4a_n}{(n+2)(n+1)}}$$
 Recursion formula

$$\therefore a_2 = \frac{4a_0}{2 \cdot 1}, \quad a_4 = \frac{4}{4 \cdot 3} \cdot \frac{4}{2 \cdot 1} a_0 = \frac{4^2}{4!} a_0$$

$$a_3 = \frac{4a_1}{3 \cdot 2}, \quad a_5 = \frac{4}{5 \cdot 4} \cdot \frac{4}{3 \cdot 2} \cdot a_1 = \frac{4^2}{5!} a_1$$

continued
above

[6C-2]

(continued)

get one series by taking $a_0=1, a_1=0$:

$$y_0 = 1 + \frac{4}{2!} x^2 + \frac{4^2}{4!} x^4 + \frac{4^3}{6!} x^6 + \dots$$

other series: take $a_0=0, a_1=1$

$$y_1 = x + \frac{4}{3!} x^3 + \frac{4^2}{5!} x^5 + \dots$$

In summation notation:

$$y_0 = \sum_0^{\infty} \frac{4^n x^{2n}}{n!}, \quad y_1 = \sum_0^{\infty} \frac{4^n x^{2n+1}}{(2n+1)!}$$

(can also write numerator as $(2x)^{2n}$)

[6C-3]

Not solved.

[6C-4]

$$\boxed{y'' - 2xy' + ky = 0}, \quad k=2m$$

$$y = \sum_0^{\infty} a_n x^n \rightsquigarrow \sum_0^{\infty} 2ma_n x^n$$

$$y' = \sum_0^{\infty} n a_n x^{n-1} \rightsquigarrow \sum_0^{\infty} -2na_n x^n$$

$$y'' = \sum_0^{\infty} n(n-1)a_n x^{n-2} \rightsquigarrow \sum_{n \rightarrow n+2}^{\infty} (n+2)(n+1)a_{n+2} x^n$$

Since $y'' - 2xy' + ky = 0$, this gives

$$(n+2)(n+1)a_{n+2} - 2na_n + 2ma_n = 0$$

or
$$\boxed{a_{n+2} = \frac{2(n-m)}{(n+2)(n+1)} a_n}$$

If $n=m$, then $a_{m+2}=0$, etc.

So: if m is odd,

take $a_0=0, a_1=1$; then

all $a_0=a_2=a_4=\dots=0$

and all $a_{m+2}=a_{m+4}=\dots=0$.

so $y_1 = a_1 x + a_3 x^3 + \dots + a_m x^m$

If m is even, take $a_1=0$.

then similarly, (so $a_3=0, a_5=0, \dots$)

$$y_0 = a_0 + a_2 x^2 + \dots + a_m x^m$$

6C-5

$$y'' = xy$$

$$y = \sum_0^{\infty} a_n x^n \quad \text{and} \quad \sum_0^{\infty} a_n x^{n+1} = \sum_1^{\infty} a_{n-1} x^n$$

$$y'' = \sum_0^{\infty} n(n-1) a_n x^{n-2} \underset{n \rightarrow n+2}{\rightsquigarrow} \sum_0^{\infty} (n+2)(n+1) a_{n+2} x^n$$

Equating coeff's of like powers of x (since $y'' = xy$) gives

$$(n+2)(n+1) a_{n+2} = a_{n-1} \quad (n \geq 1) \Rightarrow \dots$$

$$= 0 \quad (n=0)$$

$\therefore a_0, a_1$ are arbitrary, $2a_2 = 0$ (so $a_2 = 0$),

and other terms are: $a_3 = \frac{a_0}{3 \cdot 2}, a_5 = \frac{a_0}{6 \cdot 5 \cdot 3 \cdot 2} \dots$

$$a_4 = \frac{a_1}{4 \cdot 3}, a_7 = \frac{a_1}{7 \cdot 6 \cdot 4 \cdot 3} \dots$$

Taking $a_0 = 1, a_1 = 0$

$$\text{gives } y_0 = 1 + \frac{x^3}{3 \cdot 2} + \frac{x^6}{6 \cdot 5 \cdot 3 \cdot 2} + \dots + \frac{x^{3n}}{3n \cdot (3n-1) \cdot (3n-3) \dots 3 \cdot 2} + \dots$$

$$\text{taking } a_0 = 0, a_1 = 1 \text{ gives } y_1 = x + \frac{x^4}{4 \cdot 3} + \frac{x^7}{7 \cdot 6 \cdot 4 \cdot 3} + \dots + \frac{x^{3n+1}}{(3n+1) \cdot 3n \cdot (3n-2) \dots 4 \cdot 3} + \dots$$

Recursion formula

$$a_{n+2} = \frac{a_{n-1}}{(n+2)(n+1)} \quad n \geq 1.$$

$$a_2 = 0$$

($\because a_5 = a_8 = a_{11} = \dots = 0$
by the recursion formula)

6C-6

$$y = \sum_0^{\infty} a_n x^n \Rightarrow 6y = \sum_0^{\infty} 6a_n x^n$$

$$y' = \sum_0^{\infty} n a_n x^{n-1} \Rightarrow -2xy' = \sum_0^{\infty} -2na_n x^n$$

$$y'' = \sum_0^{\infty} n(n-1) a_n x^{n-2} \Rightarrow y'' = \sum_0^{\infty} (n+2)(n+1) a_{n+2} x^n$$

$$\Rightarrow -x^2 y'' = -\sum_0^{\infty} n(n-1) a_n x^n$$

$$y'' - x^2 y'' - 2xy' + 6y = 0$$

Equating coeff's of x^n to 0

gives:

$$(n+2)(n+1)a_{n+2} - n(n-1)a_n - 2na_n + 6a_n = 0$$

$$\text{or } a_{n+2} = a_n \frac{[n(n-1) + 2n - 6]}{(n+2)(n+1)}$$

$$\text{or } a_{n+2} = \frac{(n+3)(n+2)}{(n+2)(n+1)} a_n$$

RECURSION FORMULA.

This gives solutions

$$y_0 = 1 - 3x^2 \quad (a_0 = 1, a_1 = 0 = a_3 = a_5 = \dots)$$

$$y_1 = x - \frac{3}{3}x^3 - \frac{1}{5}x^5 - \frac{4}{35}x^7 - \dots$$

Radius of convergence for y_1 is determined by

$$\text{Ratio test: } \left| \frac{a_{n+2} x^{n+2}}{a_n x^n} \right| = \frac{(n+3)(n+2)}{(n+2)(n+1)} |x|^2 \xrightarrow{x \rightarrow \infty} x^2, \quad |x|^2 < 1 \quad \text{as } n \rightarrow \infty, \quad \text{if } |x| < 1$$

$\therefore R = 1$. This is expected, since in standard form, ODE is $y'' - \frac{2x}{1-x^2} y' + \frac{6}{1-x^2} y = 0$, and coefficients become infinite at $|x| = 1$.

6C-7

$$y = \sum_0^{\infty} a_n x^n \Rightarrow xy = \sum_1^{\infty} a_{n-1} x^n$$

$$y' = \sum_0^{\infty} n a_n x^{n-1} \Rightarrow 2y' = 2 \sum_0^{\infty} (n+1) a_{n+1} x^n$$

$$y'' = \sum_0^{\infty} (n+2)(n+1) a_{n+2} x^n$$

$\therefore y'' + 2y' + (x-1)y = 0$ leads to the recursion:

$$(n+2)(n+1)a_{n+2} + 2(n+1)a_{n+1} + a_{n-1} - a_n = 0$$

leading to:
two sides $y_0 = 1 + \frac{x^2}{2} - \frac{x^3}{2} + \dots \quad (a_0 = 1, a_1 = 0)$

$$y_1 = x - \frac{x^2}{2} + \frac{5}{6}x^3 + \dots \quad (a_0 = 0, a_1 = 1)$$
